## Chem 531: Problem Set \#6

Due in class: Thurs, October 26th
(1) For $\mathrm{CH}_{4}$ at $-50^{\circ} \mathrm{C}$, measured $\bar{V}$ values as a function of $P$ are

| $\bar{V}\left(\mathrm{in} \mathrm{cm}^{3} / \mathrm{mol}\right)$ | 18224 | 1743 | 828 | 366 |
| :---: | :---: | :---: | :---: | :---: |
| $\mathrm{P}(\mathrm{in} \mathrm{atm})$ | 1 | 10 | 20 | 40 |
| $\bar{V}\left(\mathrm{in} \mathrm{cm}^{3} / \mathrm{mol}\right)$ | 207 | 128.7 | 91.4 | 76.3 |
| $\mathrm{P}(\mathrm{in} \mathrm{atm})$ | 60 | 80 | 100 | 120 |

Find the fugacity and fugacity coefficient of $\mathrm{CH}_{4}$ at $-50^{\circ} \mathrm{C}$ and 120 atm (Hint: use the above data in a polynomial fit of (Z-1)/P ). Please show all work (including plots).
(2) When two phases are in equilibrium, their chemical potentials are equal (for fixed $T$ and $P$ ).
(a) Show that as the temperature is varied at constant $P$ from the transition temperature by $\Delta T$, the difference in chemical potentials between the two phases is equal to $-\Delta \bar{S} \Delta T$. Where $\Delta \bar{S}$ is the difference in molar entropies of the two phases. Assume the molar entropies are independent of $T$.
(b) then by what amount does the chemical potential of water exceed that of ice at $-5.00^{\circ} \mathrm{C}$ ?
(c) likewise by what amount does the chemical potential of water exceed that of steam at $105.00^{\circ} \mathrm{C}$ ?
(3) Carbon tetrachloride melts at 250 K . The vapor pressure of the liquid is $10,539 \mathrm{~Pa}$ at 290 K and $74,518 \mathrm{~Pa}$ at 340 K . The vapor pressure of the solid is 270 Pa at 232 K and 1092 Pa at 250 K.
(a) Calculate $\Delta H_{\text {vap }}$ and $\Delta H_{\text {sub }}$
(b) Calculate $\Delta H_{\text {fus }}$
(c) Calculate the normal boiling point and $\Delta S_{\text {vap }}$ at the boiling point
(4) The normal melting point of $\mathrm{H}_{2} \mathrm{O}$ is 273.15 K and $\Delta H_{\text {fus }}=6008 \mathrm{~J} / \mathrm{mol}$. Calculate the decrease in the normal freezing point at 500 bar assuming that the densities of the liquid and solid phases remain constant at 997 and $917 \mathrm{~kg} \mathrm{~m}^{-3}$, respectively.
(5) Using the integrated forms of the Clapeyron and Clausius-Clapeyron equations, construct the (a) solid-liquid
(b) solid-gas
(c) liquid-gas
portions of the phase boundaries for pure benzene around its triple point ${ }_{( } P_{\text {trip }}=36$ torr and $T_{\text {trip }}=278.5 \mathrm{~K}$ ) by calculating the changes in pressure when the temperature is raised and/or lowered by 2 K around $T_{\text {trip }}$. For benzene, $\Delta H_{\text {fus }}=10.6 \mathrm{~kJ} / \mathrm{mol}, \Delta H_{\text {vap }}=30.8 \mathrm{~kJ} / \mathrm{mol}, \Delta H_{\text {sub }}=41.4$ $\mathrm{kJ} / \mathrm{mol}, \rho(\mathrm{s})=0.891 \mathrm{~g} / \mathrm{cm}^{3}$, and $\rho(\mathrm{l})=0.879 \mathrm{~g} / \mathrm{cm}^{3}$.
